Session: Searching

Quick Recap of Relevant Topics

- Sorting integers
 - Selection sort
 - Merge sort
 - Counting “basic” steps in sorting an array
- Sorting strings and other data types
 - Same techniques apply
 - Appropriate comparison operator needed

Overview of This Lecture

- Searching integers
 - Linear search
 - Binary search
- Searching strings and other data types

The Searching Problem

A	
24	A[0]
18	A[1]
17	
25	A[3]
27	A[4]
24	A[5]

N = 27

Return 4

Given an array A of integers and a candidate integer N

Is N present in A? **Yes/No question**

More interesting

If N is present in A, return its index in A
else return -1

[Yes/No answer can be derived]

The Searching Problem

A	
24	A[0]
18	A[1]
17	
25	A[3]
27	A[4]
24	A[5]

N = 23

Given an array A of integers and a candidate integer N

Is n present in A? **Yes/No question**

Return -1

More interesting

If n is present in A, return its index in A
else return -1

[Yes/No answer can be derived]

The Searching Problem

A	
24	N = 24 A[0]
18	A[1]
17	Return 0
25	A[3]
27	A[4]
24	A[5]

Given an array A of integers and a candidate integer N

Is n present in A? **Yes/No question**

More interesting

If n is present in A, return its index in A
else return -1

[Yes/No answer can be derived]

The Searching Problem

A	
24	A[0]
18	A[1]
17	
25	A[3]
27	A[4]
24	A[5]

N = 24

Given an array A of integers and a candidate integer N

Is n present in A? **Yes/No question**

Return 5

More interesting

If n is present in A, return its index in A
else return -1

[Yes/No answer can be derived]

The Searching Problem

A	
24	A[0]
18	A[1]
17	A[2]
25	A[3]
27	A[4]
24	A[5]

N = 24

Given an array A of integers and a candidate integer N

In case of multiple matches, index of any one can be returned

else return -1

[Yes/No answer can be derived]

Linear Search

- Check each element of the array
- Stop on finding first match and output index
- If array exhausted and no match found, return -1

Linear Search in C++

```
int main() {  
    int i, n, A[100]; // Declarations  
    cout << "Give size of array: "; cin >> n; // Read and validate inputs  
    if ((n > 100) || (n <= 0)) { cout << "Invalid input!" << endl; return -1; }  
    cout << "Give " << n << " positive integers in array." << endl;  
    for (i = 0; i < n; i++) {cin >> A[i]; } // Read elements of array A  
    ... Code to search ...  
    return 0;  
}
```

Linear Search in C++

```
int main() {  
    ... Declarations, reading inputs and validation ...  
    int srchElement, index;  
    do {  
        cout << "Give element to search (-1 to exit): "; cin >> srchElement;  
        if (srchElement == -1) break;  
        index = linearSearch(A, n, srchElement);  
        if (index == -1) { cout << srchElement << " not present!" << endl;}  
        else { cout << srchElement << "present at index " << index << endl;}  
    } while (true);  
    return 0;  
}
```

Linear Search in C++

```
int main() {  
    ... Declarations, reading inputs and validation ...  
    int srchElement, index;  
    do {  
        cout << "Give element to search (-1 to exit): "; cin >> srchElement;  
        if (srchElement == -1) break;  
        index = linearSearch(A, n, srchElement);  
        if (index == -1) { cout << srchElement << " not present!" << endl;}  
        else { cout << srchElement << "present at index " << index << endl;}  
    } while (true);  
    return 0;  
}
```

Linear Search in C++

```
int linearSearch(int A[], int n, int srchElement) {  
    int i;  
    for (i = 0; i < n; i++) {  
        if (A[i] == srchElement) { return i; }  
    }  
    return -1;  
}
```

“Basic” Steps In Searching

- Comparing an element of array A with the searched element and incrementing index
- Count of “basic” steps
 - At most n “basic” steps to search in an array of size n
- Can we do better?

The Searching Problem

The Searching Problem

The Searching Problem

The Searching Problem

N = 18

A

18 = 18

We are done!

≥ 18

≤ 18

24

A[3]

18

A[4]

17

A[5]

General Idea

- Sort the array ($A[0] \dots A[n-1]$) in increasing order
- Check search element (m) with element at $A[n/2]$
- If m equals $A[n/2]$, we are done (return $n/2$)
- If $m < A[n/2]$, search for m in $A[0] \dots A[n/2 - 1]$
- If $m > A[n/2]$, search for m in $A[n/2] \dots A[n-1]$
- If A has 1 element and m does not match that, return -1

**Termination
Case**

**Termination
Case**

Recursion

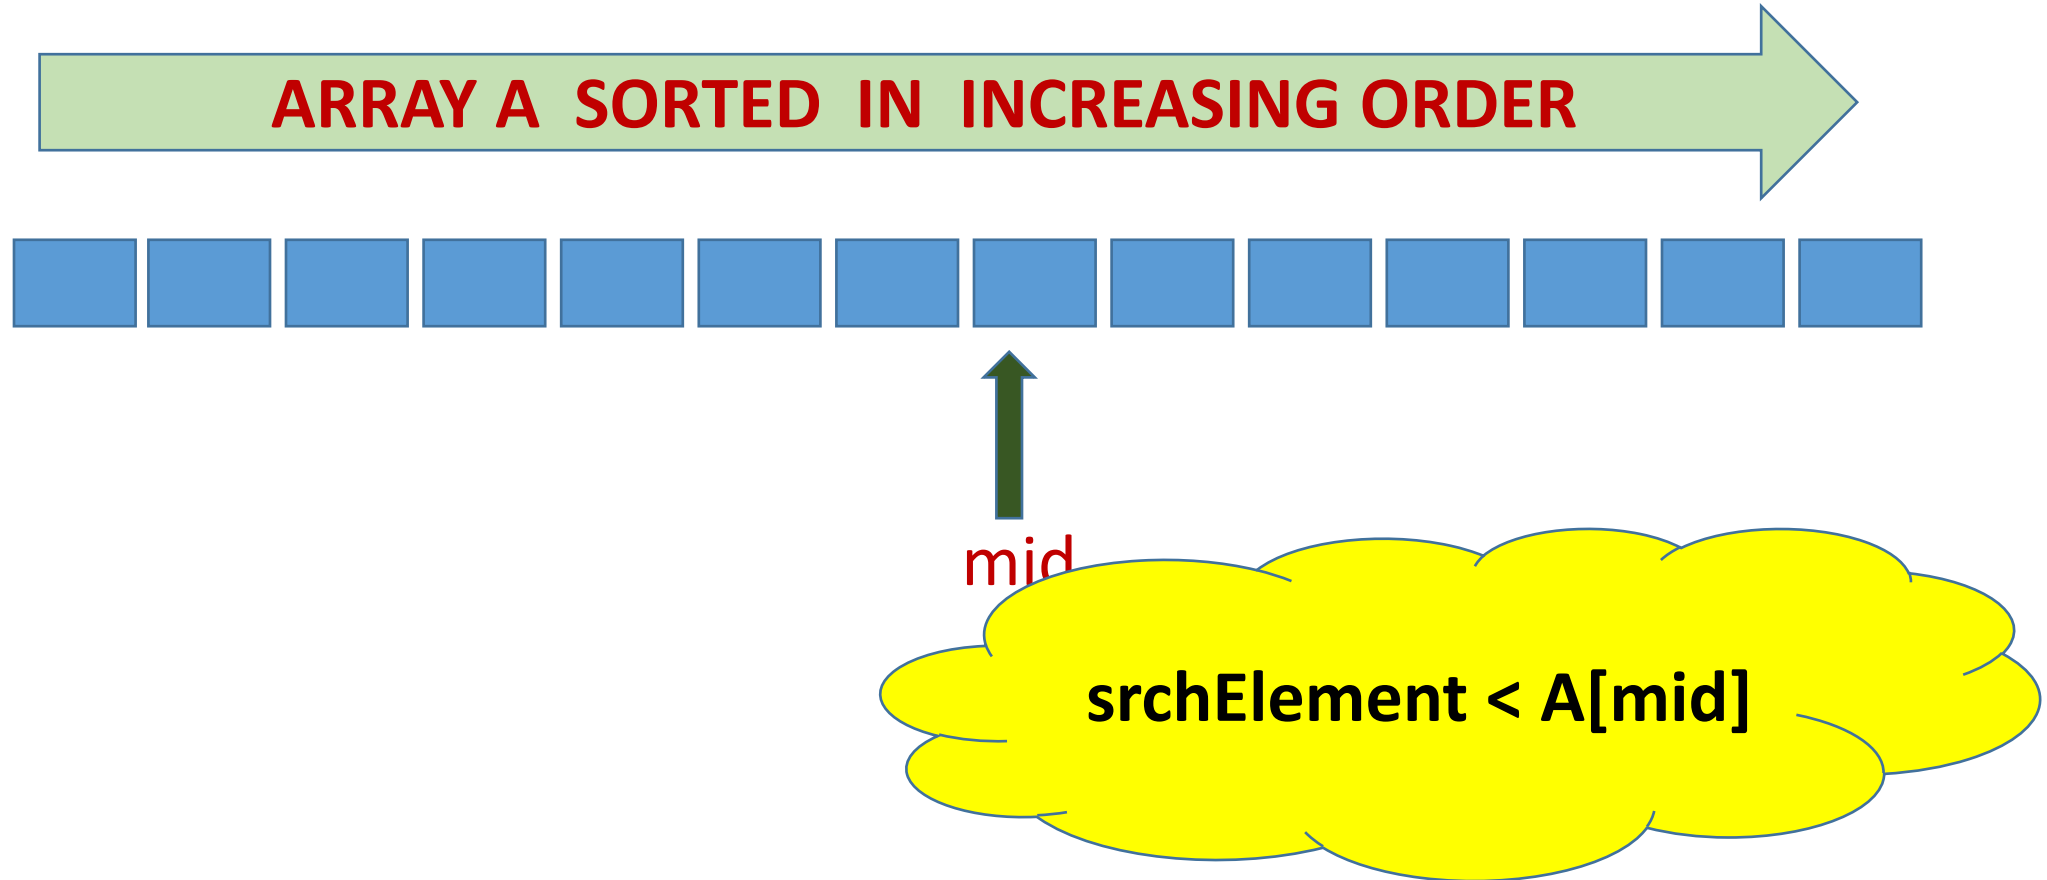

Recursion

General Idea

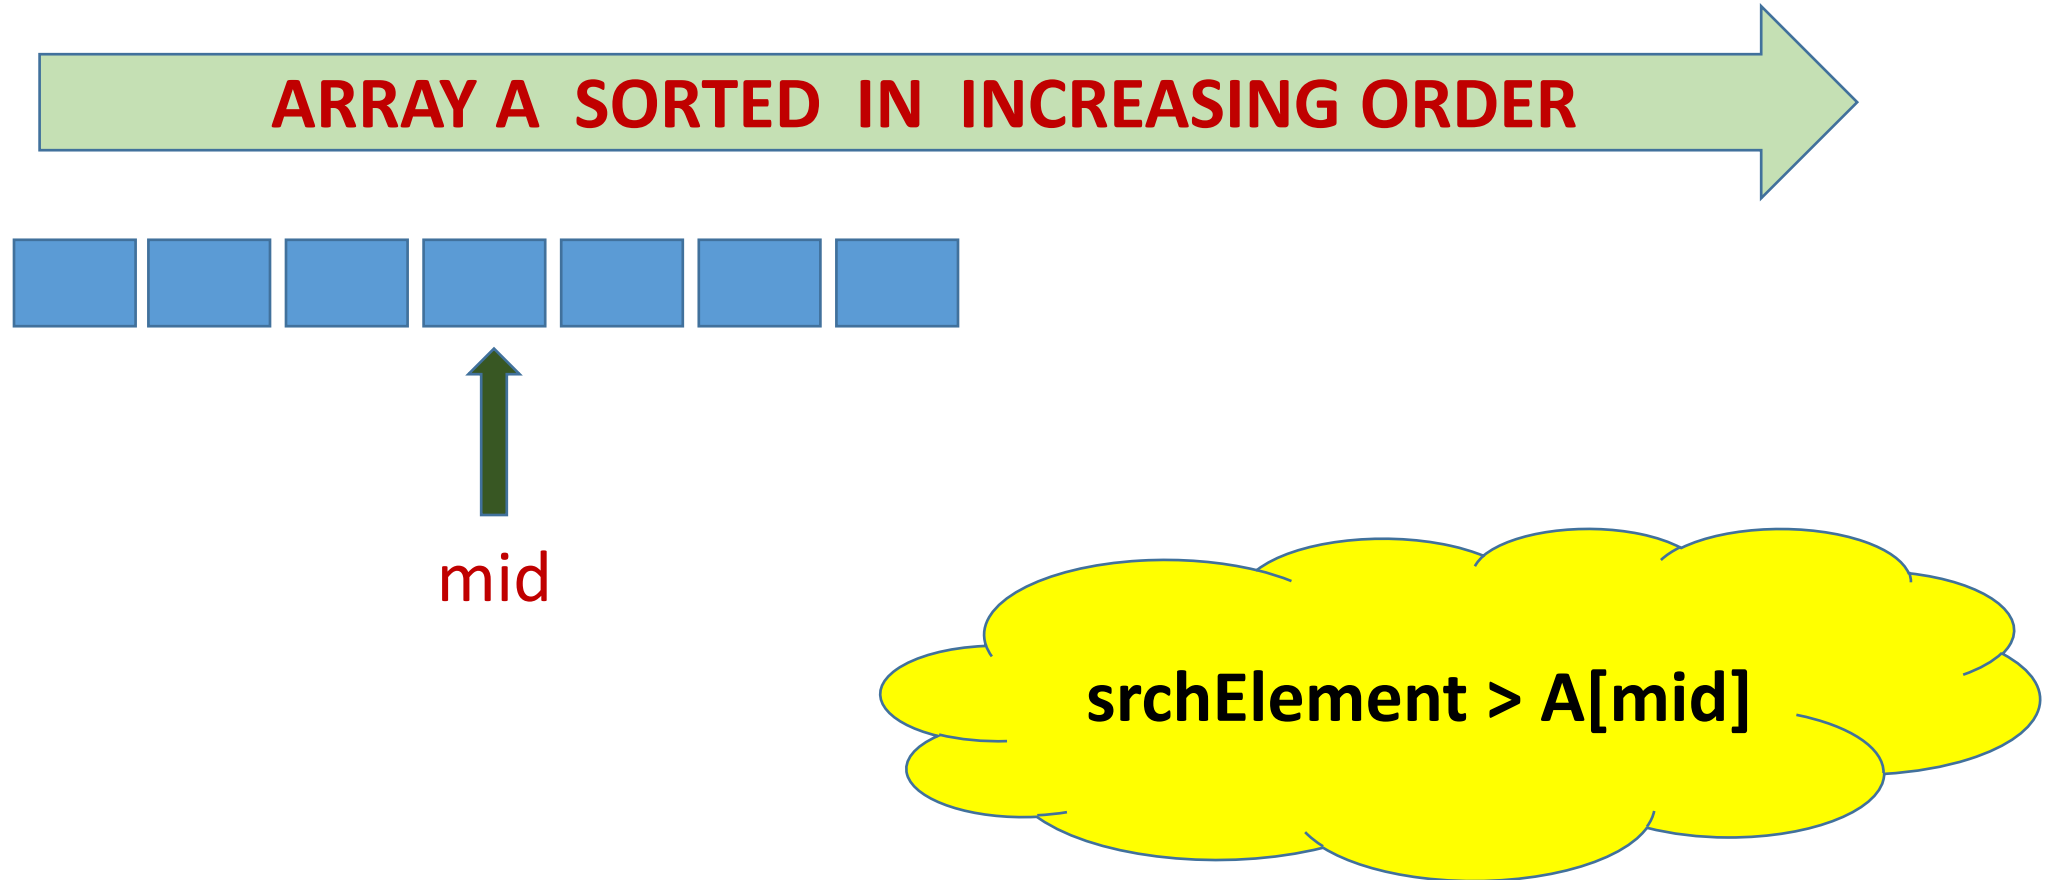

- Sort the array ($A[0] \dots A[n-1]$) in increasing order
- Check search element m at $A[n/2]$
- If m equals $A[n/2]$, return $n/2$
- If $m < A[n/2]$, search in the left half $A[0] \dots A[n/2-1]$
- If $m > A[n/2]$, search in the right half $A[n/2+1] \dots A[n-1]$
- If A has 1 element and m is not present, return -1

BINARY SEARCH

Binary Search In Action

Binary Search In Action

Binary Search In Action

ARRAY A SORTED IN INCREASING ORDER

mid

srchElement < A[mid]

Binary Search In Action

ARRAY A SORTED IN INCREASING ORDER

srchElement < A[mid]

Binary Search In Action

ARRAY A SORTED IN INCREASING ORDER

mid

srchElement == A[mid]

Binary Search in C++

// PRECONDITION: $A[\text{start}] \dots A[\text{end} - 1]$ sorted in increasing order

```
int binarySearch(int A[], int start, int end, int srchElement) {  
    if (end == start + 1) { // Array A has exactly 1 element  
        if (A[start] == srchElement) { return start; }  
        else { return -1; }  
    }  
    int mid = (start + end)/2;  
    if (A[mid] == srchElement) { return mid; }  
    else { if (A[mid] < srchElement) { return binarySearch(A, mid, end, srchElement); }  
          else { return binarySearch(A, start, mid, srchElement); }  
    }  
}
```

// POSTCONDITION: If srchElement in $A[\text{start}] \dots A[\text{end}-1]$, return its index, else -1

Binary Search in C++

// PRECONDITION: A[start] ... A[end – 1] sorted in increasing order

```
int binarySearch(int A[], int start, int end, int srchElement) {  
    if (end == start + 1) { // Array A has exactly 1 element  
        if (A[start] == srchElement) { return start; }  
        else { return -1; }  
    }  
    int mid = (start + end)/2;  
    if (A[mid] == srchElement) { return mid; }  
    else { if (A[mid] < srchElement) { return binarySearch(A, mid, end, srchElement); }  
          else { return binarySearch(A, start, mid, srchElement); }  
    }  
}
```

// POSTCONDITION: If srchElement in A[start] ... A[end-1], return its index, else -1

Binary Search in C++

// PRECONDITION: $A[start] \dots A[end - 1]$ sorted in increasing order

```
int binarySearch(int A[], int start, int end, int srchElement) {  
    if (end == start + 1) { // Array A has exactly 1 element  
        if (A[start] == srchElement) { return start; }  
        else { return -1; }  
    }  
    int mid = (start + end)/2;  
    if (A[mid] == srchElement) { return mid; }  
    else { if (A[mid] < srchElement) { return binarySearch(A, mid, end, srchElement); }  
          else { return binarySearch(A, start, mid, srchElement); }  
    }  
}
```

// POSTCONDITION: If $srchElement$ in $A[start] \dots A[end-1]$, return its index, else -1

What About Searching Other Data Types

- Exactly same technique
- Sort array
 - Use an appropriate comparison operator
 - `lexEarlier(s1, s2)` for strings
 - Custom comparison operator for other data types
- Use same comparison operator for searching
 - Decide which half of array to recurse on based on output of comparison operator

Count Of “Basic” Steps

- Let T_n be maximum count of steps when searching in array of size n
- $T_n = T_{n/2} + 1; \quad T_1 = 1$
- Solution: $T_n \approx \lceil \log_2 n \rceil$

Summary

- Searching in an array of integers
 - Linear search
 - Binary search
 - Sorting helps searching
 - Counting “basic” steps in searching
- Searching in an array of other data types
