

PH-105 Assignment Sheet - 3 (Quantum Mechanics - 2)

Umang Mathur

51. If $\phi_n(x)$ are the solutions of time independent Schrödinger equation, with energies E_n , show that $\psi(x, t) = \sum_n C_n \phi_n(x) e^{\frac{-iE_n t}{\hbar}}$, where C_n are constants, is a solution of time dependent Schrödinger equation. However, show that $\psi(x, 0)$ is not a solution of the time independent Schrödinger equation

Solution :

The Time Independent Schrödinger Equation for one-dimensional space is:

$$\hat{H}\psi = \hat{E}\psi$$

where, $\hat{H} = \frac{\hbar^2}{2m} \frac{\partial^2}{\partial x^2}$ and $\hat{E} = i\hbar \frac{\partial}{\partial t}$.

Also, since $\phi_n(x)$ are the solutions of time independent Schrödinger equation, with energies E_n ,

$$\frac{-\hbar^2}{2m} \frac{d^2}{dx^2} \left(\phi_n(x) \right) = E_n \phi_n(x) \quad (1)$$

Thus, we have,

$$\begin{aligned} \hat{H}\psi(x, t) &= \frac{-\hbar^2}{2m} \frac{\partial^2}{\partial x^2} \sum_n C_n \phi_n(x) e^{\frac{-iE_n t}{\hbar}} \\ &= \sum_n C_n e^{\frac{-iE_n t}{\hbar}} \left(\frac{-\hbar^2}{2m} \frac{d^2 \phi_n(x)}{dx^2} \right) \\ &= \sum_n C_n e^{\frac{-iE_n t}{\hbar}} \left(E_n \phi_n(x) \right) \text{ using (1)} \end{aligned}$$

Similarly,

$$\begin{aligned} \hat{E}\psi(x, t) &= i\hbar \frac{\partial}{\partial t} \sum_n C_n \phi_n(x) e^{\frac{-iE_n t}{\hbar}} \\ &= \sum_n C_n \phi_n(x) \left(i\hbar \frac{\partial}{\partial t} \left(e^{\frac{-iE_n t}{\hbar}} \right) \right) \\ &= \sum_n C_n e^{\frac{-iE_n t}{\hbar}} \left(E_n \phi_n(x) \right) \end{aligned}$$

Thus,

$$\hat{H}\psi(x, t) = \hat{E}\psi(x, t)$$

However,

$$\hat{H}\psi(x, 0) = \sum_n C_n E_n \phi_n(x)$$

. Thus, for $\psi(x, 0)$ to be a solution of TISE, we must have $\hat{H}\psi(x, 0) = E\psi(x, 0)$ for some real constant E , i.e.,

$$\begin{aligned} \sum_n C_n E_n \phi_n(x) &= E \left(\sum_n C_n \phi_n(x) \right) \\ \sum_n C_n \phi_n(x) (E - E_n) &= 0 \end{aligned}$$

However, since, \hat{H} is a Hermitian operator, the eigenvalues $\phi_n(x)$ must be orthogonal (and therefore, linearly independent).

Thus, this is possible only if $E = E_n \forall n$.

But, since all E_n s are distinct (assuming non-degenerate levels in one-dimensional space), this is not possible unless $\psi(x, t)$ is not a linear combination but only a single eigen-function.
